SPECIAL L. P. GAS SLIDE RULE

½ ACTUAL SIZE

About every bulk operator in the business today is faced with the problem of figuring temperature correction in the field by their tank truck drivers. The figuring of the temperature correcting is a tedious and time taking job, many times the driver, being human and in a hurry to get in out of the cold, or to move on to the next stop, will make mistakes by figuring with pencil. This correcting is an important asset to a bulk operator unless he wants to come up with heavy stock losses.

This slide rule has been designed to simplify and also speed up the job of correcting for those operators already using temperature corrections and for those who will soon realize the valuable assets that temperature correcting is for cutting down bulk losses and adding to profits by cutting down unneeded losses.

The rule has been field tested and proved its value time and time again, and in our own operation by temperature correcting we have been able to hold our unaccounted for to the amazing low of 1/10th of one percent.

To work you simply set the arrow to the temperature of the propane. Set the hair line on gallons delivered on scale "B". Directly opposite on scale "C" read the corrected gallons.

For example 550 gal. delivered at 25 degrees fahrenheit is 580 gallons corrected. The rule is collaborated for fills from 200 to 1000 gal on, then by dropping one zero it reads from 20 to 100 gallons. The rule is 12" long and made of hard wood for long life.

The price is \$3.00 each cash with order or COD plus COD charge. If you are not satisfied return the rule within 30 days and money will be refunded. Order one for each tank truck, bulk plant and billing dept. I am sure you will agree that an investment in these rules will be well worth the money, time and time again.

Yours truly,

H. C. TenBrook
